Project Goal

The goal of this project is to develop a **Fashion Recommender System** that recommends fashion items that are similar to given or selected one. This system will function calculating image similarity ranking.

A customer may upload an image of a fashion item or the image might be selected from an image database, then the recommender system will calculate the similarity ranking and predict some similar fashion items based on similarity ranking.

The image dataset will have metadata for the images. This metadata includes the information of gender, age category(men/women/girls/boys), item category, season, year etc of a certain fashion item. We will include these metadata of a fashion item image to filter age, gender, season etc based fashion that are complex(Not possible) to get from image alone. It will help us to avoid age and gender related major issues(mistakes) to make the system more accurate.

We will use(train) ImageNet based Keras pre-trained models(ResNet, Xception, Inception, NASNetLarge) to extract features of fashion items.

Here we will apply cosine similarity on extracted features to get image similarity ranking and will use a triplet of images to get image similarity. There will be the given image, the positive(most similar) image and the negative(most dissimilar) image, from these three images our model will find the most similar images for recommendation.

We may also use NLP to get the current Fashion trends from Social media like twitter and apply them for more accurate, specific, trendy and personalized recommendations. We may deploy humans(Stylists) to do it.

Goal of This Week

- Finalizing and checking integration of AI Model, DB and Angular app.
- Final design of DB according to last optimization of model
- Recheck and fine tune of model optimization and code refactoring.
- Completion of Angular app for UI end.
- Complete the final version of the project.

Accomplishments

- Explored different models and transfer learning on them, recorded their performance on our dataset.
 - [Model exploration-v2](#)
- Prepared Final report for project submission

Task-Time Table

Engineer	Task	Duration(hrs)	Total(hrs)
Shohag Mia	Refactoring codebase for final project submission. Also collect and add various reports, papers we had studied and other things related to the FR-System.	40	40
Muttakin	Refactoring & organizing code.	16	40
	Optimization of space and time complexity of model and inference time	24	
Safa	Prepared Final report and other documents for project submission	40	40

Plans for Next Week

- Fine tune and checking integration of AI Model, DB and Angular app.
- Recheck and fine tune of model optimization and code refactoring.
- Recheck and review everything.
- Prepare all documents.
- Submit the project and all documents.

Project Status

Green

Note -

- Green means project is on schedule and there are no major issues
- Yellow means the project is somewhat delayed and/or there may be some major risks at the current point
- Red means the project is seriously at risk of being delayed and/or there are some major risks affecting the project

Project Timeline
